

B. Database Query

1.

```
SELECT p.product_name, c.category_name, p.product_price,
       s.stock_availability, pv.provider_type_name AS provider_type
FROM tb_master_product p
JOIN tb_master_product_category c ON p.category_id = c.category_id
JOIN tb_master_product_stock_availability s
     ON TRIM(s.sku_seller) = TRIM(p.sku_seller)
JOIN tb_product_provider pv ON s.provider_type_id = pv.provider_type_id
WHERE p.product_name LIKE '%Sweaty Gold Popok%'
     AND pv.provider_type_name = 'warehouse'
     AND p.product_price < 100000
     AND s.stock_availability < 10
     AND s.eod = '2025-07-01';
```

2.

```
SELECT MAX(product_price) AS highest_price
FROM tb_master_product
WHERE product_name LIKE '%Sweaty White Popok Celana%';
```

3.

```
SELECT product_name
FROM tb_master_product
WHERE TRIM(sku_seller) IN (
    SELECT TRIM(sku_seller)
    FROM tb_master_product_stock_availability
    WHERE stock_availability > 10
```

C. Mapper Data

1.

tgl_expired terisi dan 2021-07-22 tidak lebih besar dari tgl_akhir 2021-07-31, jadi yang dipakai tgl_expired - 1.

End Date = 2021-07-21

2.

Kondisinya pakai OR, dan kelipatan = T sudah terpenuhi, jadi hasilnya min_rp.

Max Sales = 3000

3.

Kalau kelipatan = T hasilnya selalu min_rp (3000), jadi harus F supaya pakai max_rp/min_rp.

$\text{max_rp} / 3000 = 15000$, $\text{max_rp} = 45000000$

```
"min_rp": "3000",
"max_rp": "45000000",
"kelipatan": "F"
```
